# RADIOISOTOPE POWER SYSTEMS PROGRAM

## NASA RPS PROGRAM OVERVIEW: A FOCUS ON RPS USERS

John A. Hamley, Thomas J. Sutliff, Carl E. Sandifer II, and  
June F. Zakrajsek

NASA Glenn Research Center, Cleveland, OH 44135  
March, 2016

# Radioisotope Power Systems

- Enable and enhance missions by providing electrical power to explore remote and challenging environments where solar power is unavailable
  - Spacecraft operation
  - Instrumentation
- Converts heat from a Radioisotope into electricity
  - Heat is the product of the natural decay process of the isotope

- Voyager 1 & 2 – *Extended Operations*
  - Launched: August 20, 1977 & September 5, 1977
  - Arrival at Jupiter, Saturn, Uranus, Neptune: 1979, 1980/1981, 1986, 1989
  - Science Mission duration: 37+ yr science
  - Power Source:
    - Three MHW-RTG
    - 474 W<sub>e</sub> BOM

- Cassini – *Extended Operations*
  - Launched: October 15, 1997
  - Arrival at destination: July 2004
  - Science Mission duration: 7 yr cruise, ~ 11+ yr science
  - Power Source:
    - Three GPHS-RTG
    - ~885 W<sub>e</sub> BOM

# Operational Missions

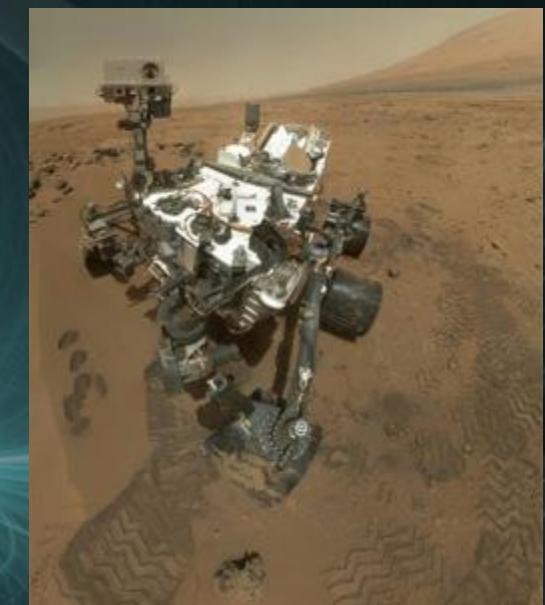

- Pluto/New-Horizons – *Operational*

- Launched: January 19, 2006
- Closest Approach / Flyby: July 14, 2015
- Science Mission duration: 9.5 yr cruise, 5 yr science
- Power Source:
  - One GPHS-RTG
  - 243 W<sub>e</sub> BOM; ~200 W<sub>e</sub> at arrival

- Mars Science Laboratory – *Extended Operations*

- Launched: November 26, 2011
- Gale Crater: August 6, 2012
- Science Mission duration: ~ 3+ yr
- Power Source:
  - One MMRTG
  - ~110 W<sub>e</sub> BOM; ~105 W<sub>e</sub> at arrival

1961

# Thermoelectric Technology Development Project

- Sustain industry capability to manufacture and test thermoelectric converters
  - Manufacture Multi-Mission Radioisotope Thermoelectric Generators (MMRTGs) and components at Teledyne Energy Systems (TESI)
- Sustain NASA (JPL) workforce of thermoelectric technologists
  - Continue testing at JPL thermoelectrics labs
  - Leverage investments in technology/component development for transition to flight
  - Actively transition advanced technologies to industry

# Path to Possible Future eMMRTG

- Enhanced Multi-Mission Radioisotope Thermoelectric Generator (e-MMRTG) Concept
  - Retrofit the MMRTG with new thermoelectric (TE) couples
    - Substitution of current MMRTG PbTe/TAGS couples with skutterudite (SKD) couples
    - Technology developed with NASA support at the Jet Propulsion Laboratory over the last 20 years
    - Key industry partners include Teledyne
    - Energy Systems and Aerojet/Rocketdyne
  - Addition of a surface oxidation layer to the heat source liner inner surface to allow for increased hot junction temperatures

2021

1961

# Stirling Cycle Technology Development Project

- Reassess Stirling Technology industry capability
- Manufactured Advanced Stirling Converters at Sunpower through end of CY15
- Sustain NASA workforce of Stirling technologists
  - Continue testing at GRC Stirling Labs
  - Leverage investments in technology/component development for transition to flight
  - Assess state of readiness of technology for flight
  - Develop requirements for flight system

Explore with radioisotope-powered missions in 3D

EYES on the SOLAR SYSTEM

The RPS Program is a joint partnership with

U.S. DEPARTMENT OF ENERGY

**Exploration Timeline**

For more than five decades, radioisotope power systems have played a critical role in the exploration of space, enabling missions of scientific discovery to destinations across the solar system. These amazing voyages have helped reveal the nature of Earth's moon and our solar system, mapped the surfaces of volcanoes on moons of the outer planets, and sustained long journeys to the outer reaches of our sun's influence.

NASA and the U.S. Department of Energy are working to ensure that this vital space power technology will be available to enable and enhance ambitious solar system exploration missions in this decade and beyond.

Nuclear Power Assessment Study—Final

## NUCLEAR POWER ASSESSMENT STUDY

Final Report

Radioisotope Power Systems Program

# Nuclear Power Assessment Study

- Study Objective
  - “Identify opportunities and challenges of a sustainable RPS and FPS provisioning strategy for safe, reliable, and affordable nuclear power systems that enable NASA Science Mission Directorate (SMD) missions and are extensible to Human Exploration and Operations Mission Directorate (HEOMD) needs in the next 20 years.”
- Planetary Science budget reductions forced a cancellation of the ASRG, but the long-term need to **develop more efficient systems** remains
- Study was intended to identify opportunities and challenges of a **sustainable, incremental development strategy** for nuclear power systems to support SMD and initial fission capabilities for HEO

# RPS Mission Planning

Strategic	Mars	Projected Launch Year	Power Reqmnt (W <sub>e</sub> )	RPS Type (Flight + Spare)	Pu-238 Availability
New Frontiers	Lunar				
Discovery	Other				
<b>Mars Science Lab</b>	Operational	2011	100	1 MMRTG	Yes
<b>Mars 2020</b>	In Development	2020	120	1 MMRTG + Spare	Yes
<b>New Frontiers 4</b>	In Planning	2024	~300	Up to 3 MMRTG/eMMRTG	Yes
<b>New Frontiers 5</b>	Notional	2030	~300	TBD	Requires new

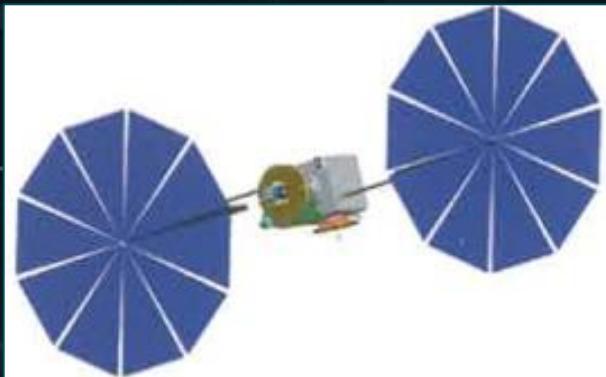

- Potential 5-6 year-cadence for New Frontier mission opportunities
  - RPS not required for all mission concepts
- Radioisotope heater units may be used on missions not requiring RPS
- Strategic missions often require RPS; 2 highest priority strategic missions in current decadal (Mars 2020 and Europa) are already in work
  - Mars 2020 will use an MMRTG
  - Europa mission will be solar powered

# MMRTG Primer

- The Multi-Mission Radioisotope Thermoelectric Generator, or MMRTG, is powering Curiosity and is the baseline power system for M2020 rover
  - Converts heat produced from the decay of plutonium dioxide into DC power
  - Power at launch is >110W DC, quiet
  - Mass is ~45kg
  - Operates in vacuum and planetary atmospheres
- 1991 Roughly speaking the generator envelope is a 60 cm diameter cylinder x 60 cm long
- It mounts using a 4-bolt interface
  - Thermal output is ~1880Wth, BOL
  - Cooling tubes are optional
  - Can be painted in black or white
    - White paint matches optical properties of MMRTG on Curiosity
- 
- MMRTG
- Design is rugged and passive
  - Series-parallel electrical circuit for increased reliability
  - Does not require in-flight commanding; nor in-flight maintenance
  - The environmental requirements include qualification to ATLAS and DELTA LV levels ( $0.2g^2/\text{Hz.}$ )
  - Nuclear Launch Safety basis was established by MSL
- As Measured**  
**F1 MMRTG Mass = 44.79 kg**

2021

# Summary

- RPS Program provides NASA a robust, end-to-end program capability
  - Customer engagement
    - Missions, 'AGs, other Stakeholders
  - DOE systems acquisition (MMRTGs)
  - DOE partnership/sustained capabilities
- Ongoing capability enhancements
  - Systems (eMMRTG)
  - Technologies (thermoelectrics and Stirling)
  - Infrastructure & Plutonium Supply Project
- Service to Missions
  - Operational (Voyager, Cassini, New Horizons, Curiosity)
  - Future (Mars 2020, potential NF-4)
